PlotSpike Pure, Premium, Proven Seed for Wildlife Plots now available

Ponchatoula, La.--Ragan & Massey, Inc. has added 3 new fall seed mixes to its line of PlotSpike Wildlife Seeds. All seed sold under the PlotSpike brand are guaranteed to be greater than 99% pure, to be the best plant selections available and are field proven.

In addition to the standard New Zealand forage brassica blend marketed in past, PlotSpike has added a Premium Fall Blend, a Clover Blend and an economical Quick Stand Premium Blend.

PlotSpike's Premium Fall Blend contains the perennial prairie brome grass. Prairie brome grass is very palatable and maintains it's very high nutritional value much longer than other grasses. Field test reveal that deer select Prairie Brome Grass from plots to graze. PlotSpike has combined prairie brome grass with forage rape, forage clovers and chicory for a smorgasbord of deer favorites.

PlotSpike's Clover Blend contains proven clovers and chicory. Clovers are legumes and are very valuable to any plot as forages and as complimentary plants. Clovers are typically very palatable and have nutritional values. Fast growing tender clover plants have very high levels of proteins and carbohydrates. Clovers are host for nitrogen fixing soil bacteria that help maintain critical nitrogen levels in the soil. Chicory is a plant used in New Zealand as forage on commercial venison farms. Chicory has an elongated leaf and produces a taproot that allows the plant to better survive drought.

PlotSpike's Quick Stand Mix is blended for quick establishment of forages in varying conditions. A Quick Stand plot will provide tender vegetation early in the season and will survive the winter in most areas of the United States. Quick Stand will establish with minimum tillage
